Agent settings

Coro provides endpoint device monitoring capabilities through the Agent:

- **Heartbeat interval**

  Defines how often Coro pings devices to monitor their security status.

- **Tamper protection**

  Prevents users and certain types of malware from tampering with important security features, disabling protection, or terminating the Agent.

- **Visibility mode**

  Generates events and sends notifications to end users without performing any automatic remediation. Windows devices only.

- **Self-update**

  Configures the Coro Agent to auto-update when new versions are released.

- **Advanced threat control**

  Monitors active processes for known and potential threats, and blocks processes (that are not explicitly *allowlisted*) that exhibit suspicious behavior.

- **Secured shadow backup protection**

  Enforces backup snapshots every four hours and blocks processes that exhibit risks to the backup. Windows devices only.

- **Enhanced EDR block mode**

  Enables Enhanced EDR (endpoint detection and response) block mode to ensure access to timely data that may otherwise be suppressed by the environment.

- **Initial scan**

  Configures the Coro Agent to perform an initial malware and ransomeware scan upon installation.
