Slack detection and remediation

Slack offers limited malware detection. Slack protection features include:

1. Scanning files during upload to a Slack channel, halting the upload process if Slack detects malware.

2. Performing periodic offline scans of previously uploaded files to ensure ongoing security.

Coro does not extend malware detection and file quarantine to Slack cloud storage due to limitations of the Slack API.

> **Note**
>
> Although Coro does not extend malware detection and file quarantine to Slack cloud storage, user actions such as access permission violations, suspected identity compromise, mass data download/deletion, and sensitive data exposure are monitored.
