>
> Here's what you need to know:
>
> - **Limited support**: Expect minimal technical support at this stage.
> - **Potential bugs**: Your feedback is crucial. If you encounter any issues, report them to us at **support@coro.net**.
> - **Not for production**: This feature is not yet ready for full production use or mission-critical applications.
> - **Constant improvements**: Things might change as we refine and enhance components.
> - **Release updates**: Stay tuned for official release news. We'll keep you posted on any changes.

This article describes Coro's **Inbound Gateway** email security add-on and how it can help protect your users' incoming email.

Introducing the Inbound Gateway

As standard, a Coro subscription enables organizations to configure anti-malware and anti-phishing protection for the email accounts of **protected users** in connected applications.

The Inbound Gateway add-on takes this protection one step further by offering a full email proxy gateway solution that intercepts all inbound emails destined for accounts in specified domains hosted on Gmail, Microsoft 365, and other third party email providers.
