

Device Password Missing

A device password is a security feature implemented on both *Windows* and *macOS* devices to enhance the protection of data and sensitive information stored on the device. Enforcing a device password ensures that unauthorized users cannot gain easy access to a device.

Creating a new Device Password Missing policy

To create a new **Device Password Missing** policy:

1. From the **Device Posture** tab, select **+ ADD**:

2. Select **Add to Windows** or **Add to macOS**.
The **Add new device policy** dialog appears.
3. Select **Device Password Missing** from the **Select policy type** dropdown.
