# Firewall disabled

A firewall is a security feature that monitors and controls network traffic. It enforces rules to allow or block incoming and outgoing data, protecting the device from unauthorized access and cyber threats. Enabling a Firewall enhances system security by acting as a barrier between the device and the internet.

Creating a new Firewall disabled policy

To create a new **Firewall disabled** policy:

1. From the **Device Posture** tab, select **+ ADD**:

2. Select **Add to Windows** or **Add to macOS**.

   The **Add new device policy** dialog appears.

3. Select **Firewall disabled** from the **Select policy type** dropdown.
