

Changing the encryption strength

The Coro VPN offers two encryption strengths:

- AES-128: faster, enterprise-grade security
- AES-256: slower, military-grade security

By default, a virtual office has an encryption strength of AES-128. Admin users can change the encryption strength from the **Virtual Office** section of the Network module.

Note

Changing the encryption strength disconnects your virtual office from the internet for a few minutes. Coro recommends making this change during non-business hours.

To change the encryption strength:

1. Sign into the Coro console.
2. Navigate to **Control Panel -> Network -> Virtual Office**.
3. Scroll down to the **Encryption strength** section:

Encryption strength

- AES-128**
Faster, enterprise-grade security.
- AES-256**
Slower, military-grade security.

4. Select the desired encryption strength.
5. Select **YES, CHANGE** in the confirmation dialog:
