Introducing the Network module

Coro's Network module enables businesses to create a secure virtual office that protects against external and internal attacks. Coro Network focuses on the security of your computer networks and the data that is transmitted between them. Key components include VPNs, access control (who can and cannot access certain resources from various networks), and data encryption.

> **Note**
>
> You must install the Coro agent on your endpoint devices for the Network module to function. For more information on the Agent, see **Coro Agent**.

To learn more about the Network module, use the following links:

- **Virtual office**
- **Settings**
- **Optional: Secure web gateway (SWG)** *add-on*

You can access the Network module from the **Actionboard** or **Control Panel**.

From the **Actionboard**:
