

Coro high-level architecture

Coro protects and monitors your cloud applications, users, and devices. To add Coro protection to your organization, talk to your sales representative or subscribe to one of our plans offered at [Coro.net](https://coro.net).

Coro cybersecurity platform contains multiple components that work together to provide a complete cybersecurity solution. This article offers a high-level overview of each component, how they work, and the roles and responsibilities involved in deployment.

Coro service

A Software-as-a-Service (SaaS) cloud component that forms the core of the Coro solution. It handles all data processing, analysis, reporting, and communication with endpoint devices and the various cloud applications with which Coro can work.

The Coro service runs within a highly secure and fully redundant AWS environment, with all data and communication between the Coro service and other components being encrypted and monitored for suspicious activity.
