

The Coro workspace

A Coro workspace is a virtual environment that encapsulates all relevant information for an administrator or security operative. Each administrator can access the Coro console to their own workspace to connect to cloud applications, add protected users, and define settings and policies for their subscribed protection modules.

Note

Managed Service Providers (MSPs) and partners can create one or more *child* workspaces for their customers. For more details, see [Manage workspaces overview](#).

Cloud applications

Workspaces are tied to specific domains in connected cloud applications and services. When you connect Coro to a cloud application, you specify a domain or administrative business account on that application.

This enables Coro to connect to the application and identify **protectable user accounts** which are then manageable within your workspace.
