

Setting Permissions for your cloud applications

For Coro to monitor and report security issues, at least one cloud application must be connected.

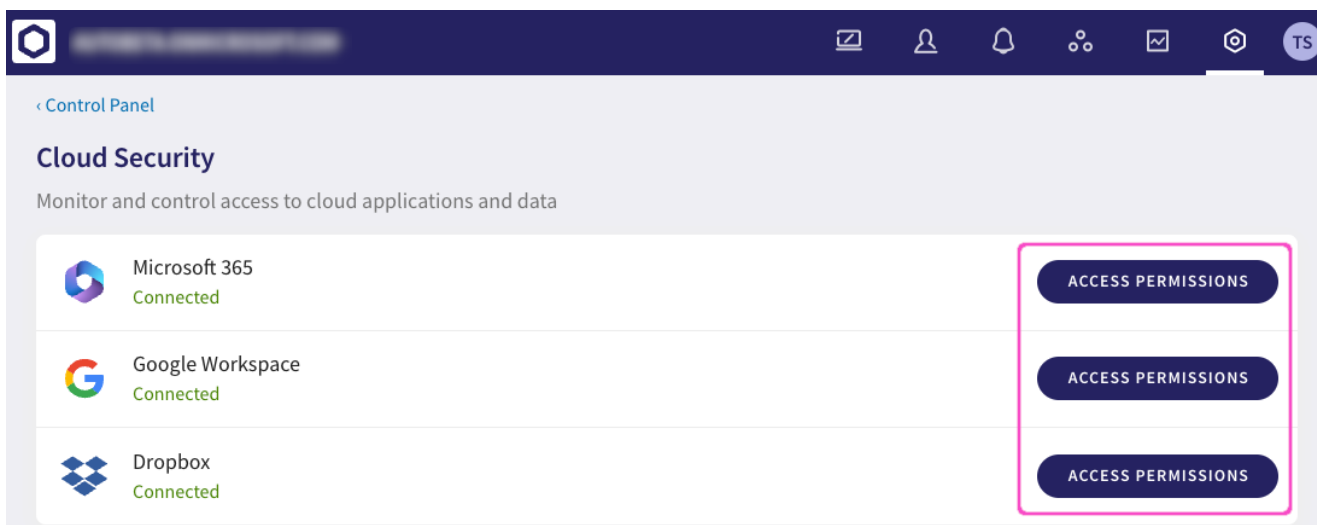

Note

To see a list of supported cloud applications, see **Introducing cloud security**.

Coro supports the ability to set access permissions for connected cloud applications. In other words, you can allow access to an application based on whether a user meets a defined set of criteria.

To configure access permissions for a service:

1. **Log into the Coro console** and go to **Control Panel > Cloud Security**.
2. From your list of connected cloud application, select the corresponding **Access Permissions** button:

3. On the **Access Permissions** page for your application, select **+ NEW PERMISSIONS** to add a new permission rule:
