

v1.9.1

Version 1.9.1 provides existing feature enhancements and fixes:

Enhancements

Following are enhancements to existing features that we're releasing with version 1.9.1:

1 - Aliases

Coro now detects and links all *aliases* (O365, Google) to the relevant protected user account to ensure the user is always protected regardless of the number of *aliases* associated with them.

Additionally, all *aliases* (O365, Google) can be viewed in the **Protected users** widget under the **Emails** header, as well as in the **Control Panel > Protected Users** (expand the **Aliases** list under each email address).

The screenshot displays the 'Protected users' interface. On the left, a list of 13 users is shown. The 'qa3 user' is highlighted. On the right, a detailed view of the 'qa3 user' is shown, including their email addresses and a list of aliases.

2 - Agent Update Message

When the agent is scheduled to be updated for an endpoint, the message related to the action that triggered the update now emphasizes that the agent will be updated to the latest *stable* version.
